Cloud Pro Translator

Live, multilingual translation for your service, event, or meeting —
spoken in one language, heard in many.

What is Cloud Pro Translator?

Cloud Pro Translator is a browser-based live translation system. You speak into a microphone; your words are transcribed, translated into the languages you've chosen, and delivered to your audience in real time — as captions on their phone, or spoken aloud in their language.

Nothing to install. The speaker opens a broadcast page; the audience opens a link. No headsets, no translation booth, no per-seat hardware. Just a web browser on whatever device each person already has.

“A visitor came to our Sunday service who only speaks Portuguese. She sat in the third row with her phone, and she heard the whole sermon in her own language.” — what your guests will say

What it does for your audience

- **Live captions in 100+ languages.** Each person picks their own language and sees the translation appear as you speak.
- **Spoken translation, not just text.** The viewer can read the captions or have them read aloud in a natural voice through headphones.
- **No app to install.** Your audience opens a web link on their phone — iPhone, Android, tablet, laptop — and joins the session.
- **Low latency.** Translations appear within a couple of seconds of you speaking, so people can follow along in real time.
- **Private to your session.** Each broadcast has its own link — only people you've shared it with can join.

Key features

V

Voice or captions — their choice

Each viewer decides independently whether to read captions or have the translation spoken aloud through their device. Premium neural voices available.

O

One shared link for the whole audience

Share a single viewer URL — everyone joins the same session, each picking their own language. No per-seat setup, no per-language link.

I

Instant, low-latency translation

Speech is streamed to the cloud, transcribed, and translated as you talk — captions typically appear a second or two behind your voice.

C

Custom vocabulary

Teach the recognizer the names, places, and technical terms it needs to get right — 'Ecclesiastes', 'Kubernetes', your company name, whatever your speakers actually say.

E

Edit and export transcripts

Every session can be captured as a transcript. A companion Editor app lets you clean it up afterwards and export for notes, subtitles, or follow-up emails.

S

Speaks 100+ languages

Powered by Google Cloud Speech, Google Translate, and Gemini. Your audience picks from dozens of European, Asian, African, and Middle-Eastern languages.

How it works

Three moving parts — but from your point of view, it's just 'press Start and talk'.

1

The speaker broadcasts

You open the Broadcast page in your browser, pick a microphone, and press Start. Your audio streams to the cloud where it's transcribed in real time.

2

The system transcribes and translates

Speech is converted to text and translated into every language your audience has picked. The text is published instantly to a shared session that viewers are watching.

3

The audience reads or listens

Each viewer opens the session link on their phone, chooses their language, and decides whether to read captions or hear the translation spoken aloud. Done.

Setup is one-off: once your broadcast page is configured with your custom vocabulary and preferred defaults, running a session is as simple as opening a web page.

Example use cases

A few of the places Cloud Pro Translator earns its keep.

Churches with multilingual congregations

Scenario: “We have Spanish-, Portuguese-, and Mandarin-speaking visitors. How do we include them in the service?”

How it helps: The preacher speaks in English; visitors scan a QR code on the welcome card and pick their language. They hear the sermon translated live through earbuds — no booth, no separate service, no wait.

Conferences, training, and corporate meetings

Scenario: “Our speaker is presenting in English but a quarter of the room is more comfortable in another language.”

How it helps: Attendees join the viewer link on their laptops or phones and pick their language. They read captions alongside the talk — no interpreters, no headset rental, no change to the presentation.

Tours, classrooms, and community events

Scenario: “Our group has mixed languages and we can’t afford professional interpreters for every visit.”

How it helps: The guide or teacher broadcasts from a phone in their pocket. The group reads or listens on their own devices, in their own language, at their own pace — including any reading-back later from the saved transcript.

Ready to start?

If you'd like to bring live multilingual translation to your services, events, or meetings, I'd love to help. The quickest way in is to book a free consultation call — I'll walk through a live demo, talk through your setup, and work out what makes sense for your situation.

What's included

- Configured Broadcast page for your organisation
- Shareable viewer link for your audience (any device, any browser)
- Custom vocabulary tuned to your speakers, names, and jargon
- Premium voice output (neural TTS) for spoken translation
- Transcript capture + the Editor app for post-production cleanup
- Hosted and maintained — no server to manage on your side

Pricing depends on how often you run sessions and how many languages you need live. Get in touch for a quote — a typical church or small-event setup runs in the low tens of dollars per month in cloud costs, plus a one-off setup fee.
